

## Walder® boom brake

Controls the horizontal and vertical movement of your boom – allowing it to sweep gunwale to gunwale with complete safety.

The boom is not stopped dead in its tracks but, rather, travels from gunwale to gunwale in a gentle controlled sweep.

The braking effect is achieved by the frictional force produced as the line slides and tightens around the drum of the Walder® boombrake.

With the Walder® boombrake rigged, all that's needed when sailing down-wind is to apply tension to the line, without leaving the safety of your cockpit. You're really not need to climb on the deck.
